

Contract Verify

A wallet-aware preflight desk for Intelligent Contracts.

PROJECT BRIEF

Know before you call.

GenLayer Contract Verify helps builders validate an EVM contract address, confirm wallet context, and understand the interaction path before connecting a real transaction flow.

READ-ONLY PREFLIGHT

Address + chain + bytecode

SIMULATED LIFECYCLE

Prepare -> consensus -> complete

WHY IT IS SAFE

The demo button never calls `eth_sendTransaction`, never requests a signature, and never moves funds. Only the optional `eth_getCode` probe reads from the connected provider.

One clear path from wallet to confidence.

The interface keeps network context and transaction state visible without pretending a local demo is blockchain finality.

01

Connect wallet

Read the active account and chain ID from an injected EVM wallet.

02

Select environment

Choose Bradbury Testnet, Asimov Mainnet, or Local Studio.

03

Set contract target

Validate the 20-byte EVM address before any provider call.

04

Run preflight

Probe bytecode with `eth_getCode` when the wallet chain matches.

05

Simulate lifecycle

Walk through Prepare, Simulate, Consensus, and Complete locally.

IMPLEMENTATION NOTE

Real RPC endpoints should be verified against official GenLayer docs before production use.

A small contract with a real intelligent path.

The included Python contract is designed for a fast Studio review:
it stores the latest result and can independently inspect a public page.

```
contracts/contract_verify.py
```

```
verify_from_page(address, source_url, network)  
gl.nondet.web.get + gl.eq_principle.strict_eq
```

STUDIO STEPS

- 1 Open studio.genlayer.com and create a new Intelligent Contract.
- 2 Paste `contracts/contract_verify.py` into the Studio editor.
- 3 Deploy it in the local Studio environment.
- 4 Call `verify_from_page` with a public explorer or contract page URL.
- 5 Read `latest_verification` and confirm the stored snapshot.

JUDGING-SAFE DISCLOSURE

The browser lifecycle is simulation-only. The Studio contract interaction is separate and is the part that demonstrates GenLayer state + validator consensus.

Ready to hand over.

Keep the source files in GitHub. Use this PDF as the reviewer-facing overview and checklist, not as a replacement for the runnable repo.

REPOSITORY CONTENTS

- ☐ README.md - setup, behavior, and Studio instructions
- ☐ contracts/contract_verify.py - Intelligent Contract
- ☐ docs/SUBMISSION.md - portal and GitHub checklist
- ☐ src/App.tsx - wallet, preflight, simulation behavior
- ☐ src/index.css - responsive product styling

FINAL CHECKLIST

- ☐ Push the project folder to a public GitHub repository.
- ☐ Add the live demo URL to the portal submission.
- ☐ Run the contract once in GenLayer Studio.
- ☐ Confirm demo transaction copy says no funds and no signature.
- ☐ Complete the final portal submission from the project owner's account.

Source folder is ready in the project artifact.
